

Feeding Systems

for individual stables

Horseking Feeding Systems for individual stables make it possible to automate the provision of concentrate feed as well as hay. All feeding is controlled by a central feeding computer. Horses receive their feed in individual, frequent rations distributed throughout the day. This has a very positive effect on the horse's digestive system and considerably reduces the risk of feed-related

illnesses, such as colic. At the same time, the frequent feeding intervals keep the horses occupied, thereby reducing the risk of any harmful incidents in the stable.

For the horse owner, the installation of the **Horseking Feeding System** means a noticeably reduced workload as well as the opportunity for more flexible working times. The

Horseking Feeding System, with its various elements, can be installed very easily into both existing and new stables.

The exact details of any installation are determined by the type of stables for which it is required, meaning that the function and design of the system can be combined for optimum results.

product information

Concentrate Feed Dispenser K 100.0

the mobile feeder for larger stables

The Horseking Concentrate Feed Dispenser K 100.0 offers the opportunity of providing each horse with it's own exact rationed quantity of concentrate and mineral feeds. This can be provided in up to 10 portions per day.

The quantity and frequency of feeds for each horse can be set easily. The K 100.0 moves along the stable corridor on a rail and stops automatically in front of each box. The quantity of

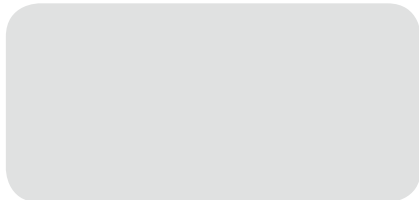

feed set is funnelled into the trough by a computer-controlled channel or by dispensing pipe. The K 100.0 then moves on to the next box. At the end of the feeding time, the unit moves back to the starting point. Here the battery is loaded and the feed hopper is refilled.

Up to nine feed stuffs can be fed: four concentrate feeds, four mineral feeds and one liquid feed. Up to 100 horses can be provided with con-

centrate feed using the Horseking Concentrate Feed Dispenser K 100.0. The siting of the running rail in the stable corridor is decided upon in each individual case, given the type of buildings being employed. It is possible to achieve very sharp bends and even increases in gradient.
