

# Concentrate Feeding Station

## how the Horseking Concentrate Feeding Station works

The Horseking Concentrate Feeding Station offers the opportunity to provide horses with concentrate and mineral feeds on an individually calculated and exact basis. The quantity of feed and the number of portions can be very easily set for each individual horse. The horse is recognised by means of the transponder, which is either introduced as an intra-muscular injection or is worn as a marker on a special collar.

The feed ration is matched to the speed with which the horse eats at the trough. If a horse does not have the opportunity to take his hourly portions due to a temporary absence from the group, he or she would then receive the quantities missed at a later feeding time. A computer-controlled barrier ensures that each horse can eat his or her food in peace and without being disturbed.

Horseking® Concentrate Feeding Station K 30.0 incl. automatic filling system

The barrier ensures an undisturbed feed

Leaving the concentrate feeding station via the exit gate
